

EXPERIMENT NO.9

Name: Bhagyesh Patil

Class:D20A

Roll No:3

Batch:A

Aim: To implement a Private Ethereum Blockchain using Geth.

Theory:

Ethereum is an open-source, decentralized blockchain platform that enables developers to build and deploy **smart contracts** and **decentralized applications (DApps)**. Unlike public blockchains such as the Ethereum mainnet, a **Private Ethereum Blockchain** is restricted to specific participants, making it ideal for **development, testing, and enterprise applications** where confidentiality, control, and performance are essential.

Geth (Go-Ethereum) is one of the most widely used Ethereum clients, written in the Go programming language. It allows users to run an Ethereum node, mine Ether, and interact with the blockchain through **JSON-RPC, command-line, or JavaScript consoles**.

Setting up a **Private Ethereum Network** involves creating a customized blockchain environment isolated from the public Ethereum network. It enables developers to test smart contracts, consensus mechanisms, and network behavior without incurring gas costs or depending on public validators.

Steps Involved:

1. **Choosing a Network ID:**
2. Each private blockchain must have a unique network ID to differentiate it from public or other private networks.
3. **Choosing a Consensus Algorithm:**

4. Ethereum supports different consensus mechanisms such as **Proof of Work (PoW)** and **Proof of Authority (PoA)**. In private networks, **Clique (PoA)** is often used for faster block confirmation.
5. **Creating a Genesis Block:**
6. The genesis block is the first block of the blockchain, defining network parameters such as difficulty, gas limit, initial account balances, and consensus settings.
7. **Initializing the Geth Database:**
8. The `geth init` command initializes the blockchain using the `genesis.json` file, preparing the data directory for node operation.
9. **Setting up Networking:**
10. Nodes communicate using **enodes** (Ethereum Node URLs) that contain IP addresses and public keys for peer discovery and connection.
11. **Running the Member Nodes:**
12. Each participant runs a Geth node that connects to the private network and participates in block validation and transaction processing.
13. **Running a Signer (in Clique):**
14. In the **Clique consensus**, designated **signers** validate and sign blocks. These accounts are pre-configured in the genesis file to ensure trusted block production.

Note: Download the genesis file and edit the account details, including the public keys of all participating peers in the network.

Step 1: Installing Geth on Ubuntu

3. Step - 3: Create a Private Ethereum Network

1. Create a folder named, private_ethereum_setup

```
ubuntu@ubuntu:~/Desktop$ mkdir private_ethereum_setup
```

2. Create 2 subfolders named node1 and node2 in the folder private_ethereum_setup

```
ubuntu@ubuntu:~/Desktop$ cd private_ethereum_setup/
ubuntu@ubuntu:~/Desktop/private_ethereum_setup$ mkdir node1 node2
```

3. Create 2 accounts in the folder corresponding to node1 and node2

```
ubuntu@ubuntu:~/Desktop/private_ethereum_setup$ geth --datadir node1 account new

3. On the third Terminal, Run Node 2

```
ubuntu@ubuntu:~/Desktop/private_ethereum_setup$ geth --datadir node2 --port 30307 --bootnodes enode://f7aba85ba369923bffd3438b4c8fde6b1f02b1c23ea0aac825ed7eac38e6230e5cadcf868e73b0e28710f4c9f685ca71a86a4911461637ae9ab2bd852939b77f@127.0.0.1:0?discport=30305 --networkid 1234 --keystore "./node2/keystore" --unlock 0xfc09dce1AB0Fe679e5cC09D88B3E99de13864433 --password "./password.txt" console
```

```

5. Step - 5 : Exploring the network by attaching JavaScript console to Node 1

1. Fetch network status

```
> net
{
  listening: true,
  peerCount: 1,
  version: "1234",
  getListening: function(callback),
  getPeerCount: function(callback),
  getVersion: function(callback)
}
```

2. To fetch the number of blocks mined

```
> web3.eth.blockNumber
0
> INFO [03-23|12:15:29.133] Looking for peers peercount=1
   tried=0 static=0
```

3. To check the balance of the accounts

```
centage=72 elapsed=0m42.708s
> eth.getBalance(eth.accounts[0])
1.000322e+24
> INFO [03-31|12:09:54.727] Generating DAG in progress
```

4. To fetch the details of the latest mined block

[illegible]

5. To fetch the details of a specific block

[illegible]

6. To check the account balance of the peer machine, provide their Public Key

```
INFO [03-31|12:13:17.467] Looking for peers
> eth.getBalance("0x9f9497c56b54890fD2f693BaC26C71e4736eb2bE")
1.000322e+24
INFO [03-31|12:13:17.464] Looking for peers
```

7. Fetch the details of the peers in the network

```
> admin.peers
[[
  {
    caps: ["eth/66", "eth/67", "eth/68", "snap/1"],
    enode: "enode://dce739f3f2fae54667568d84488b8d055409c862e80d78d653bf086b250ddd431fa6c6342502f9ff8f99129b5ee055679fab9335a9049ec7ae1b13941bb265e@127.0.0.1:30307",

    name: "Geth/v1.11.6-stable-ea9e62ca/linux-amd64/go1.20.3",
    network: {
      inbound: false,
      localAddress: "127.0.0.1:36900",
      remoteAddress: "127.0.0.1:30307",
      static: false,
      trusted: false
    },
    protocols: {
      eth: {
        version: 68
      },
      snap: {
        version: 1
      }
    }
  }
]]
```

8. Perform Transactions between peers in the network

```
> eth.sendTransaction({from:"0x9F9497c56b54890fd2F693BaC26C71e4736eb2bE",to:"0xfc09dce1AB0Fe679e5cC09D88B3E99de13864433"})

9. Check the balances of sender and receiver 2

```
> eth.getBalance("0x9F9497c56b54890fd2F693BaC26C71e4736eb2bE")
1.000322e+24
```

10. To check the details of the transaction on Node 1 Terminal

```
> eth.getTransaction("0xe181e503b93f95f2e69553091fbdd8459eda0942662c68ead0c5492779cf31c7")

Conclusion:-

The experiment successfully implemented a **Private Ethereum Blockchain** using **Geth** and **Clique (PoA)** consensus. By initializing a custom **genesis block**, an isolated network was established for zero-cost testing. This setup proved that authorized signers can effectively validate transactions without the computational overhead of public networks, providing a secure environment for enterprise DApp development.
